

SHARE Release 2.3.0

Known Issues Solved with minor update on December, 10th, 2009

- Imputation module wave 2
The imputation module included some wrong variable labels. Please note that SHARE wave 2 variables *ep205*, *ep207*, *hh002*, and *hh011* ask for *net* income (in SHARE wave 1 *gross* income was asked). The variable labels in the *capi* modules are correct. In the imputations module for wave 2 for the variables *ydip*, *yindv*, *yohmv*, *yohbv*, *hgtincv* we changed the variable labels to "net", as the imputed income variables for wave 2 are also net income measures.
- Documentation of imputation module
The appendix E of this documentation lists the variables included in the wave 1 and wave2 imputation modules. Some minor errors were corrected. Typos in variable names: *fdistress*, *pultv*, *prltv*. Variables *age* and *grip* (imputations wave 1) and variables *age* and *gender* (wave 2) are not included in the imputations modules but were listed in the first version of release 2.3.0 documentation.
- Stata Versions of CH modules (wave 1 and wave 2)
The CH modules were saved in Stata 11 format ("format-114 datasets") and could not be opened with older versions of Stata. Now all modules including CH are saved in Stata 8/9/10/11 readable data format.
